

1: Advocating for restrictions

Grassroots!

Organize small events for the cause

Post on social media

Talk to local news stations

Strikes!!!!

Advocate through your law makers!

Letters

Emails

Phone calls

2: Applying those restrictions

A few ways to go about these restrictions

Copyright Laws

- Currently, copyright laws don't apply to AI training models. So artists have no protection if their art is used without their consent

Consensual AI training

- If an artist is okay with their art being used in AI training models, then there's no problem! However, there is currently no way to regulate this.

Artists's Protections

- Artist's jobs are at stake due to image-based AI generators like Adobe Firefly, ChatGPT, and many more.

Animator's Protections

- Animator's jobs are at stake due to video-based AI generation tools like SoraAI

Writer's Protections

- Scriptwriters and author's jobs are at stake due to text-based AI generators like ChatGPT
- Adding protections for these creatives would be a step in the right direction!

3: Doing your part

Refrain from using AI for creative purposes!

Commission artists!

- Many are currently struggling due to the aforementioned problem.
- So they get a little money, and you get awesome art! Its a win-win!

Learn to draw / animate!

- It's tough, and it takes time. But I guarantee you the process will be worth it. Making art yourself is far more rewarding than having a computer do it for you.

Refrain from using AI in general!

Just, do your homework yourself

- Trust me, it makes you smarter

THINK OF YOUR OWN IDEAS

- Ideas made by you are going to go SO much further for several reasons. Number one being that you actually care about your ideas. Number two is that it promotes *critical thinking* which is something that we're losing as a society.

4: AI Programs to look into

ChatGPT: The big one that everyone knows, and is a general all around threat to artists, writers, and animators. It has capabilities for essentially anything. Jack of all trades.

Adobe Firefly: Adobe's native AI generation tool. It can oftentimes be used to perfectly cover up blemishes in photos (like a better photoshop), but can be used to replicate artist's styles and art.

SoraAI: One of the current largest threats to artists and animators, SoraAI can almost perfectly replicate any animation style *with* voices, also putting voice actors in danger.

5: Hurdles

Money: This should be obvious. Money makes the world go 'round, so crowdfunding is essential.

Gaining support: Many are opposed to the idea of AI restrictions. So gaining support may be difficult. But never impossible!

Actually doing the work: Lots of this is a lot to ask of people. So getting the work done may prove to be difficult as a lot of it is reliant on public support.
